

Sniper-HDPro-8mm

The Sniper-HD Pro will transfer both silent super 8 and silent regular 8mm plus super 8 sound film in one, easy to use unit. Best of all, the unique design of the Sniper-HD Pro means that you only have to thread film through the sound head if it has a sound track. All silent film bypasses the sound head for ease of use and less wear on both the film and the unit. You can transfer the audio at the same time or, for problem reels with troublesome splices, you can bypass the projector and transfer the audio on a separate pass. The Sniper-HD Pro will also transfer color and black and white negative.

The ScanStream Sniper-HD Pro incorporates a built-in HD camera for direct, frame-by-frame scanning off the enlarged gate for access to 100% of the film frame. The Sniper-HD scans off the sharper, emulsion side of the film at full 1080p using a CMOS hi-definition sensor containing almost 3 million pixels for maximum clarity. A diffused light source reduces the appearance of scratches, and fewer optical surfaces to keep clean means less maintenance and increased productivity. The Sniper-HD comes with a super bright, ultra-cool LED light source that will protect the film from burning or warpage. The Sniper-HD has auto exposure or manual exposure via a handy remote. An on-panel preset lets you fine tune the exposure for maximum shadow and highlight detail in the film.
